Add Vinegar
If you don't like your doughnuts greasy, add a tablespoon of vinegar to the batter. The vinegar absorbs the grease that otherwise would be in the finished product.

Fresher Cake
To keep a cake fresh, cut in half and cut the slices straight across, then press the halves together, wrap in wax paper and put in cake tin.

Can Make or Break a Garden

Humus Is An Important Element in Soil

By HENRY FREE

"What is humus?" This is one of the most common garden questions asked. Humus is the most important soil constituent and our most valuable natural resource, even more valuable than minerals or water power.

Without humus your garden soil would be dead and unsuited for growing plants. Humus helps and improves thin, sandy soils by giving them more body, and improves heavy, stiff clay soils by loosening them.

Humus may be any organic or nonmineral materials which may accumulate in a soil naturally, such as leaf mold in the woods, dead grasses or weeds, or peat, formed by the dying of water plants in ponds and bogs, and their accumulation on the bottom.

However, gardeners must work it into garden soils in the form of manures, peat moss, compost, green manure resulting from cover crops, lawn clippings, sawdust, or many other substances. A soil well fortified with humus is usually rather dark in color, friable and porous. And to make a soil more valuable the gardener must not forget that ample drainage is likewise necessary.

Drain-Naturally

Sandy topsoils drain naturally, but clay topsoils seldom drain well because of an impervious subsoil. So the deeper you work the humus into the soil, the better it will drain.

The best humus the gardener can use is rotted manure, but manures are not readily obtainable, and rather high in price. And, since leaf mold and compost are usually difficult to accumulate in quantities sufficient to

improve the soil, the gardener can resort to peat moss which is accessible, not expensive, and so easy and pleasant to use. Peat moss, plus fertilizer, is all a humus should be. It is porous, non-caking, and may be dug into the soil at any time of the year.

For the established garden peat moss may be used as a protective mulch during the growing season, and then cultivated or turned under to increase the humus content of the soil. As well as eliminating weeds a peat moss mulch protects plant roots from the drying effects of sun and wind.

The soil never hardens and cakes and the roots with ample air and moisture are always feeding and growing, thus better plants, flowers and vegetables will result. Consequently, one of the gardener's never-ending tasks is to keep his soil supplied with humus, no matter what kind.

Several of the recently introduced soil conditioners are worthwhile additions to the topsoil because they prevent, to a large degree, caking of the surface soil. Try one but do not expect a miracle.

Try Shortcuts To Housework

CHICAGO (AP) — Your summer design for living should be the simple approach. Tried and tested tricks for cutting down housekeeping should appeal to any housewife. Here are some pointers well worth considering:

1. Protect your living room curtains by backing them with clear plastic shower curtains. The shower curtains may be attached easily with shower hooks to screen draperies from dust and sudden rainstorms.

2. Tack plastic film over upholstered seats of your dining room chairs. You can keep the plastic covers fresh with soap and water during the hot months and upholstery should be clean and bright when you remove the covers in the fall.

3. Make a cool-looking white turkish toweling slipcovers to protect your fine upholstery. They are not only handsome but can go right into the washing machine and need no ironing.

Chilled Soups

Black bean, cream of celery, cream of chicken, and tomato are all condensed soups that are excellent to serve chilled for hot-weather meals.
